

Introduction

- For the Stanford Political Union's, we host weekly community discussions where we come together as a group (open to all members of the Stanford community) to discuss a contentious topic on the news (or something evergreen).
- To gather an idea of what the community's views before and after the discussion, we used to work with Poll Everywhere to conduct simple polls where respondents would answer a single question on a scale. However, this had two serious limitations:
 - It only captured aggregate, overall movement. We lost data about how individual opinions changed.
 - The poll was based on a single question, which had to be created by collapsing the diverse array of questions we discuss for that particular event.

Design and Style

- The color palette of the app should match that of the Stanford Political Union
 - Cardinal red (HEX #8C1515)
 - Light red (HEX #B83A4B)
 - Dark red (HEX #820000)
 - White (HEX #FFFFFF)
 - Black (HEX #2E2D29)
 - Cool grey (HEX #53565A)
- Font
 - Logo: Libre Baskerville (bold)
 - Discussion: Montserrat
 - Formal text: Libre Baskerville
- General themes:
 -

Front-end Specifics

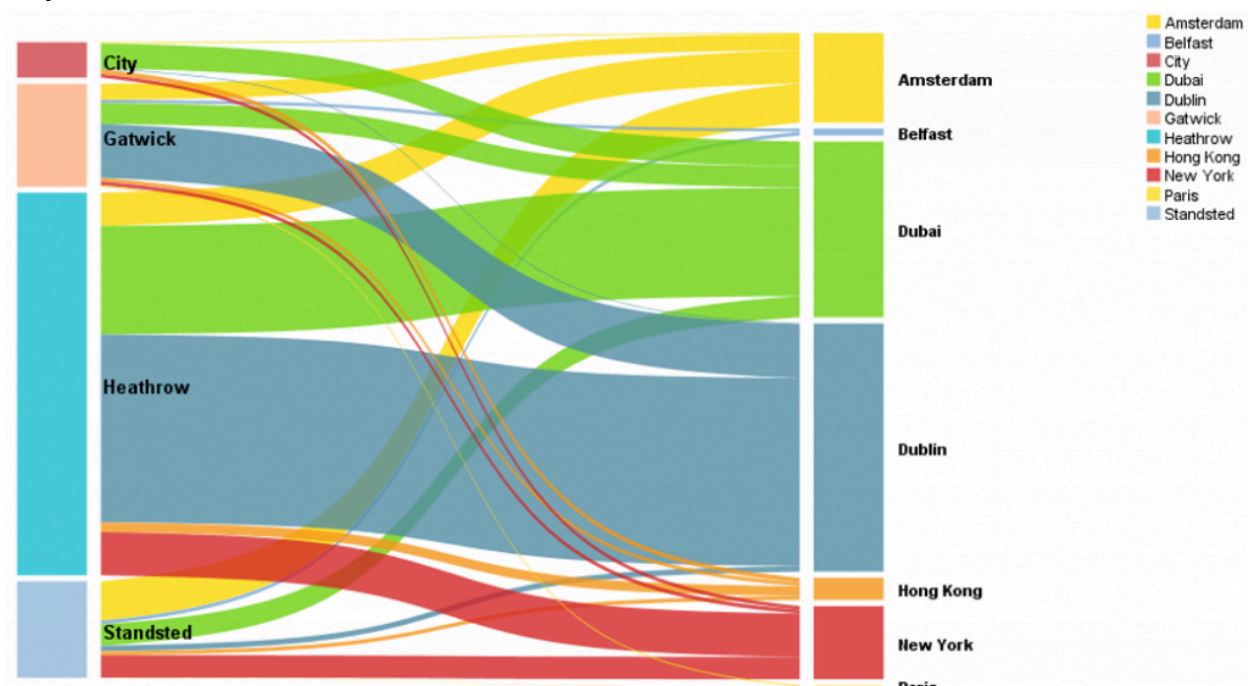

- I'd like to make a live poll website that I can use during presentations.
- There should be two different kinds of logins: poll administrator and poll participant
- **Poll participant:**
 - It should start with a QR code that comes on the screen. The QR code is a way for users to participate in a unique session of the app.
 - The typical type of question that will show up is political ideology leaning. For instance, a question might be "to what extent do you support the war in Iran?" and there is a 1-5 scale with 1 = not at all and 5 = completely.
 - Each user who scans the QR code will get a screen on the website that has these 1-5 options.
 - This will show up at the beginning and the end of the event. The question should reset for the respondent, but their previous response should be maintained on the backend.
- **Poll administrator:**

- The administrators of the poll should be able to, for each discussion, set up two poll instances with the same question or set of questions—before discussion and after discussion.
- The goal of the website is to deliver meaningful information from the poll that can be used to comprehend the nature of beliefs in the room before and after a discussion, in terms of not just what the aggregate beliefs are, but especially how individuals have changed their beliefs over the course of the discussion.
- The final deliverable data should take some form of a slideshow. You can swipe through different slides with information.
- At the end of each pre-discussion session and the post-discussion session, the administrator of the poll must receive the set of slides. The slides are just infographics—nothing more; no unnecessary fluff.
- The post-discussion slides must—very importantly—highlight how the change in opinions have occurred.

Back-end Specifics

- This will be based on device and ideally have the same identifier (like the same phone) from session to session.
- This will ultimately be used to create a movement map (consider a Sankley diagram) to show the percentage and direction that people moved through the discussion. Ideally, this will also get stored in a CSV file to enable long-term data collection about the same people throughout time.

Inspiration

Left side corresponds to pre-discussion poll, and right side to post-discussion. For one question, it is the same options on either side.

For design inspiration, please consult the following images:

Closing Notes

- Please ask any clarifying questions and build a full plan for the buildout.
- Do not over-engineer the product. Keep it simple, clean and intuitive. No extra words if it is really not needed.
- If you have any ideas that will make the website better than what the current idea is, please feel free to share.

Elements:

- In a folder called 'elements', you will find PNG files of the different versions of our logo.
- Please feel free to ask if you require any additional design elements that have been already established for our club.

Technical implementation:

- Main language: Python

- Backend: A traditional database format is not necessary. Supabase free tier will suffice.
- Hosting: front-end (for poll participants) is hosted via a website contained in a GitHub repository.
